

I Missed That

Accessibility at a table is a contract. We're the clerk that holds both sides to it.

For hard-of-hearing and late-deafened adults, in hearing rooms — work meetings, family dinners.

Every accessibility tool puts the burden on one person

Read faster. Ask again. Get told "never mind." Today, the deaf person carries the whole contract alone.

"I work in marketing and we have these weekly team meetings where everyone just talks over each other... I've started just nodding along even when I have no idea what was decided... I genuinely don't know what I signed up for."

— r/deaf, 35↑

"Sometimes I didn't know how to respond because I wasn't even sure what exactly had been said... they assumed I was lying."

— r/deaf, 25↑

"Asking people to repeat themselves a couple times and still not totally hearing or understanding them and then they say 'Never mind' or 'It's not important'."

— r/hardofhearing, 13↑ thread

Why "just add captions" isn't enough

- **51.9%** of DHH live-caption users are frustrated with caption quality
- ASR lag of **1–2s** is rated *worse* than the errors themselves
- DHH caption comprehension drops above **170 wpm** — live group speech runs **160–220 wpm**
- Only **4%** of non-speech info (laughter, tone, applause) ever reaches a caption
- **96%** of deaf children are born to hearing parents — this is the default room, not the exception

The contract

Accessibility at a table is a contract between everyone present. We're the clerk that holds both sides to it — Claude is the clerk any team can hire; the contract and the evidence are ours.

The table's side	Your side
Join by phone (QR, no install)	Ledger — decisions with the reason , threads (who replied to whom)
Pace bar goes amber on overlap or speed	Addressed-to-you, the moment it happens
One-at-a-time nudge when it flaps	Away detection → catch-up card, on its own
	Speak for me — one tap, said in the next gap
	Doubt words — low-confidence words flagged, tap to ask for a repeat

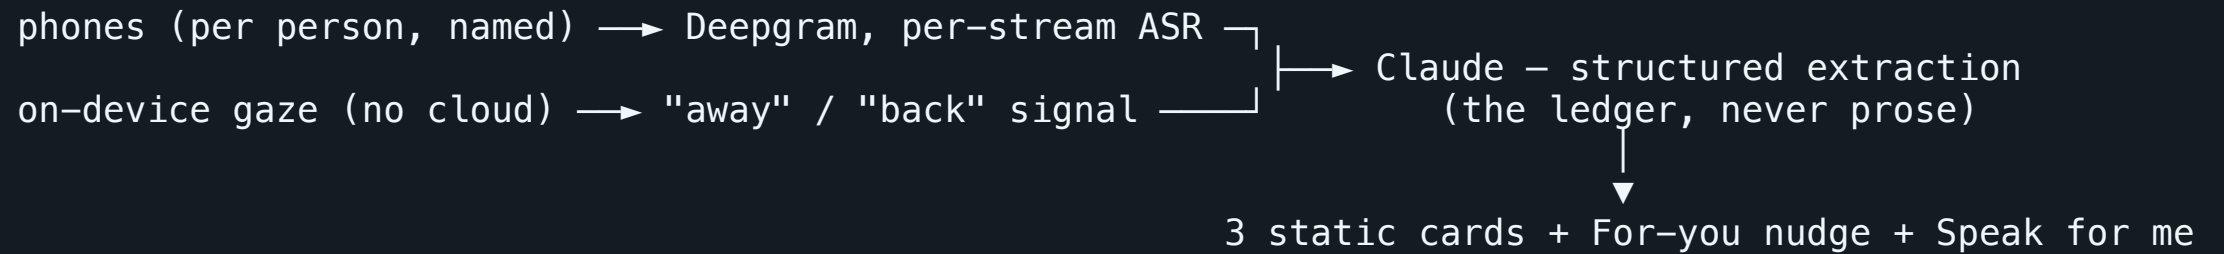

Ava does the mics. We do what the mics are for.

What's new

Tool	What they already do	What nobody (before us) does
Ava	Phones join as named mics, speaker colors, type-to-speak	No ledger — the reason, the objection, the thread all vanish once said
Otter / Zoom "Catch me up"	Post-meeting or on-demand summary	Summary <i>resolves</i> the debate — drops the live objection while it's still open
MS Teams	Live captions + logged-in speaker names	Breaks on overlap; nothing addressed-to-you; no away detection
Caption glasses (XRAI, Captify, AirCaps)	Captions in your line of sight	Arms fight hearing aids/CIs; still just words — no state
I Missed That	—	Reasons, threads, addressed-to-you, away card, speak-for-me, doubt words

How it works

Nothing is stored after the session — in-memory only, gone on close.

Scope, limits, next

Built for: hard-of-hearing and late-deafened adults, in hearing rooms — work meetings, family dinners.

Not built for: sign-first Deaf users, classrooms with interpreters, gamers.

Tested with: not yet tested with a hard-of-hearing user.

Next: HoH user tests, Turkish, glasses as a display of the same feed.
